

# KIBlock Introduction

Lecture *Machine Learning* vom 23.3.2022

Lars Gabriel, Felix Becker, Mario Stanke  
Institut für Mathematik und Informatik  
Universität Greifswald

# Administratives

- Time frame: 9:00-16:00 from march 23rd to 25th
- Lunch break: ~12:00-13:00
- Course material (slides, code, data sets, ...):
  - <https://github.com/mslehre/KI-Block>
  - <https://moodle.uni-greifswald.de/course/view.php?id=5405>
- Questions and feedback outside of the course (moodle forum):
  - <https://moodle.uni-greifswald.de/mod/forum/view.php?id=146549>
- JupyterHub Uni Greifswald:
  - <https://jupyterhub.wolke.uni-greifswald.de/hub/login>
- Course instructors: Felix Becker, Lars Gabriel, Stefan Simm

# Prerequisites

- Connection to the network of the University of Greifswald
- Basic programming skills in any language
- Basic calculus and linear algebra (derivation, matrix multiplication)

$$\nabla E(\theta) = \left( \frac{\partial E(\theta)}{\partial \theta_0}, \dots, \frac{\partial E(\theta)}{\partial \theta_n} \right)^T, \begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix} \cdot \begin{pmatrix} 3 & 2 & 1 \\ 4 & 1 & 0 \end{pmatrix} = \begin{pmatrix} 11 & 4 & 1 \\ 25 & 10 & 3 \\ 39 & 16 & 5 \end{pmatrix}$$

- Familiarity with numpy syntax

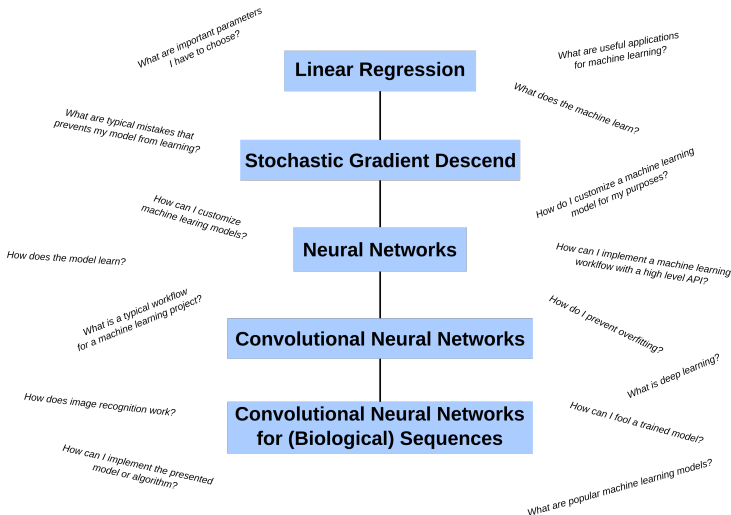

```
[1]: import numpy as np

[3]: A = np.array([[1,2],[3,4],[5,6]])
      B = np.array([[3,2,1],[4,1,0]])
      C = np.matmul(A,B)
      C

[3]: array([[11,  4,  1],
           [25, 10,  3],
           [39, 16,  5]])
```

# KI-Block 2022 - Overview

# Natural Language Processing

- *GPT-3*<sup>1</sup>: 175 billion parameters
- Pretraining on large text corpus (transfer learning)
- Task-agnostic (can be used for many purposes e.g. translation or text generation)
- word embeddings:

Male-Female

Verb tense

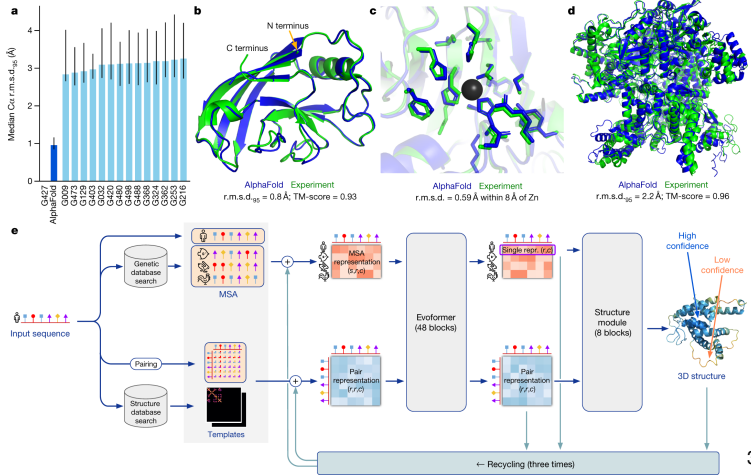

Country-Capital

<sup>1</sup>Language Models are Few-Shot Learners, Brown et al., 2020

<sup>2</sup>[towardsdatascience.com/creating-word-embeddings-coding-the-word2vec-algorithm-in-python-using-deep-learning](https://towardsdatascience.com/creating-word-embeddings-coding-the-word2vec-algorithm-in-python-using-deep-learning)

# AlphaFold

<sup>3</sup>Highly accurate protein structure prediction with AlphaFold, Brown Mann  
Ryder Subbiah et al., 2020

- Reinforcement learning by self-playing symmetric games millions of times in parallel
- Beat the top ranked Go player in the world
- Uses neural networks to make an educated guess on the best actions (policy) and their expected outcome

<sup>4</sup>A general reinforcement learning algorithm that masters chess, shogi, and Go through self-play, Silver et al., 2018

- ResNet<sup>5</sup> are very deep networks with great performance in image classification
- Introduced a very useful trick (residual connections) for stable training with large numbers of layers
